INTELLECTUAL PROPERTY DUE DILIGENCE REPORT

Project Larkspur — CAL-218 Programme

Prepared by Hartington IP for Hartwell Pharma Limited | 28 October 2025 | STRICTLY CONFIDENTIAL

1. Executive Summary

This report summarises the intellectual-property and freedom-to-operate (FTO) due diligence undertaken in respect of Calbryn Therapeutics Limited's pre-clinical KRAS G12D programme (CAL-218), which Hartwell Pharma Limited proposes to in-license on an exclusive worldwide basis (Project Larkspur). Our overall conclusion is that Calbryn holds a defensible core patent position over the CAL-218 chemical series and that the FTO risk is moderate and manageable, subject to the specific points raised in sections 4 to 6 below. We did not identify any matter that, in our view, should prevent the transaction from proceeding on the proposed terms.

2. Scope and Materials Reviewed

We reviewed: (a) the patent families listed in section 3; (b) the prosecution histories on the public UKIPO, EPO and USPTO registers; (c) Calbryn's laboratory notebooks and invention-disclosure records relating to the lead and back-up compounds; (d) the sponsored-research agreement with the University of Cambridge dated 3 March 2022; and (e) the data-room materials at index reference LK-DR v3.

3. The Calbryn Patent Estate

Family	Subject matter	Earliest priority	Status
CAL-218-A	Core composition of matter (pyridopyrimidinones)	12 March 2021	Granted GB; EP/US/JP pending
CAL-218-B	Crystalline forms and salts	4 August 2022	GB and PCT pending
CAL-218-C	Methods of treatment	21 October 2022	PCT filed; national phase pending
CAL-301-A	Allosteric modulators (option asset)	15 January 2023	GB pending

4. Validity and Prosecution Risk

4.1 CAL-218-A: A third-party observation was filed at the EPO on 14 April 2025 citing WO 2019/118822 (Mirati). Following claim amendments filed on 2 June 2025, Calbryn's attorneys consider the independent composition claims remain novel and inventive. We assess the residual risk to the core claims as low-to-moderate.

4.2 CAL-218-B: A first examination report dated 9 July 2025 raised inventive-step objections to two dependent claims only; the independent claim is not in issue. We assess this as low risk.

5. Ownership and Encumbrances

5.1 Calbryn is recorded as applicant/proprietor for all families. Chain-of-title from the named inventors is documented through employment agreements and assignments, copies of which we reviewed and found in order.

5.2 The only third-party right identified is the non-exclusive, royalty-free academic research licence granted to the University of Cambridge (clause 2.3 reservation territory only; internal non-commercial use). This does not conflict with the exclusive commercial licence proposed.

6. Freedom to Operate

6.1 We identified two third-party families of potential relevance: Amgen WO 2021/041671 and Boehringer EP 3 805 218. On the basis of the claim language as currently granted/published and the structure of the CAL-218 series, we consider that the CAL-218 compounds fall outside the scope of

both. We recommend that the position be kept under formal review as the Amgen application progresses and as the CAL-218 development candidate is finalised.

6.2 No blocking third-party patent was identified in respect of the proposed indications.

7. Recommendations

We recommend that Hartwell: (i) obtain the ownership and no-conflicting-grant warranties at an enhanced liability cap, which has been achieved in the executed Agreement at £18,000,000; (ii) require Calbryn to keep the EPO observation and Amgen prosecution under review and to share material developments through the JSC; and (iii) take an assignment-ready prosecution authority over the families in case Calbryn elects not to maintain any family. These recommendations have been reflected in the transaction documents.
